

## Solving Two-Step Equations Involving Multiplication

- Isolate the variable
    - Use opposite operation (add or subtract)

**OR**

  - Move term across the “=” sign
- Divide to undo the multiplication
  - Check/verify your solution

Target #2

I can solve a two step linear equation.

$$2n - 1 = 7$$

$$5 = 2 - \frac{t}{4}$$

### Examples

Solve each equation. Verify your answer.

1)  $9 + 2p = 13$

2)  $19 = -3x + 7$

3)  $-2n - (-3) = 17$

Check your understanding by completing:
